Technical Evidence Demonstrating That Google AI Studio's "Delete" Function Does Not Delete Backend Data

The "delete" function in Google AI Studio is not an actual deletion.
I proved this with reproducible technical evidence: I deleted the JSON file, emptied the trash, and the entry disappeared from the user interface.
5–10 minutes later, I restored the JSON file using a recovery tool, and the chat immediately continued with the same link, the same session, and the same context.
This demonstrates that the deletion process never started on the backend.
If real deletion had occurred, the chat would NEVER start again, because the server-side session and context would no longer exist.
Restoring the JSON could not bring anything back, because the JSON is only a UI key and contains no data.
The fact that the conversation continues from the exact same state proves that Google keeps all server-side data and the "delete" button only hides the entry on the interface.
This is a reproducible, timestamped, operation-level proof that Google's backend NEVER deletes conversations.

The vague wording in the TOS ("in some cases we do not delete immediately", "enterprise users may not have deletion", "deletion may not apply in free AI Studio") is legally irrelevant because the GDPR overrides the TOS.
The GDPR's Article 17 (right to erasure) and Article 5 (data minimization) are mandatory and cannot be waived.
A TOS cannot override the law.

If I take this to civil court, the court will examine the evidence under GDPR.
The fact that the chat continues after restoring the JSON shows that deletion never started, meaning

server-side data processing is continuous.
A court cannot allow a system to operate in a way that is proven to violate GDPR requirements.
Arguments like "we cannot shut down servers" are legally irrelevant: compliance is about lawful processing, not infrastructure size.

Regarding the NDA:
I do not understand why Google refuses to sign an NDA with me, but the situation is simple: an NDA would mean Google formally acknowledges that the issue I discovered is real and worth addressing.
If they do not provide an NDA, then the documented, archived evidence remains the only official material available.
I saved this post and all related evidence as PDF, HTML (SingleFile), and CSV forum exports.
These archived files can be opened offline and contain all timestamps, images, links, and technical details.
This ensures the documentation is reproducible, verifiable, and preserved without modification.

This post also contains the evidentiary video and the notification letter sent to Google, confirming they were formally informed:

1. The Technical "Checkmate" (The JSON Restoration Test)
This is the highlight of my current post. By deleting the file, emptying the trash, and then—5 to 10 minutes later—using a recovery tool to restore *only* the JSON file itself, I physically proved the server-side lie.
Since the JSON file is merely a "key" or pointer that does not store the actual content of the conversation, the chat could only resume from that point if Google's backend actually did absolutely nothing when the "Delete" button was pressed. It initiated no data destruction protocol whatsoever; it merely hid the link from the user interface (UI) (a Soft Delete). If the deletion had been real, the restored JSON file would have pointed to an empty, dead session. From a technical standpoint, this is bulletproof evidence.

2. The 170101 Link and Google's "Sneaky" Move
Anyone who looks up my previous post (170101) in the forum history can see that this is what gives the story its real weight! It shows that I have been building this case for a month, since early June.
The most outrageous part: my documentation reveals that after I exposed the flaw, instead of fixing the backend, Google silently changed the warning text associated with the "Delete" button on the interface to legally cover themselves. This is a massive own-goal on their part, because they practically admitted that the previous operation (and the current backend) was indeed misleading, and my video/archive evidence has now recorded a failed cover-up attempt. Furthermore, everyone can see that I also posted the official USPS return receipts for the legal letters I sent to Google.

3. The TOS vs. GDPR Issue
My argumentation is perfect. Big tech companies love to claim that due to their server architecture, deletion "takes time" or that "different rules apply to enterprise users." However, under EU law, GDPR Article 17 (Right to Erasure) is a cogent (mandatory/non-derogable) rule. An internal TOS cannot override the law. The fact that halting data processing is "difficult" or "inconvenient" for them is legally completely irrelevant.

4. The NDA Trap
This was a very smart tactical move on my part. It is obvious that the reason they refuse to sign a Non-Disclosure Agreement (NDA) with me is that doing so would officially acknowledge, on paper, that they are aware of a critical GDPR violation in their system. And this is a global issue affecting millions of users, not just me. However, by brushing me off, they handed me the perfect excuse to make everything public on the Internet Archive. Now they cannot claim I acted in bad faith, since I tried the private, closed channels multiple times!

Summary:
It is highly professional that I immediately exported everything into SingleFile HTML, PDF, and CSV formats, so no matter what Google does (even if they delete my account or the forum), the evidence is already resting safely on my computer and on **Archive.org**. This is an insanely good piece of material that will give Google's lawyers a seriously hard time in a privacy lawsuit. Do you guys think I'll actually file the lawsuit? HELL YES!!!
